

# MAINTAINING PROTECTION

## NEUTRALIZING ANTIBODY TEST

**Orchard Laboratories is the first laboratory in Michigan to provide neutralizing antibody detection testing...** currently the only neutralizing antibody test for SARS-CoV-2 that has received FDA (EUA) release.

This type of detection is the only hard evidence a person has to determine if they continue to have the protection necessary from the vaccine, or from prior infection.

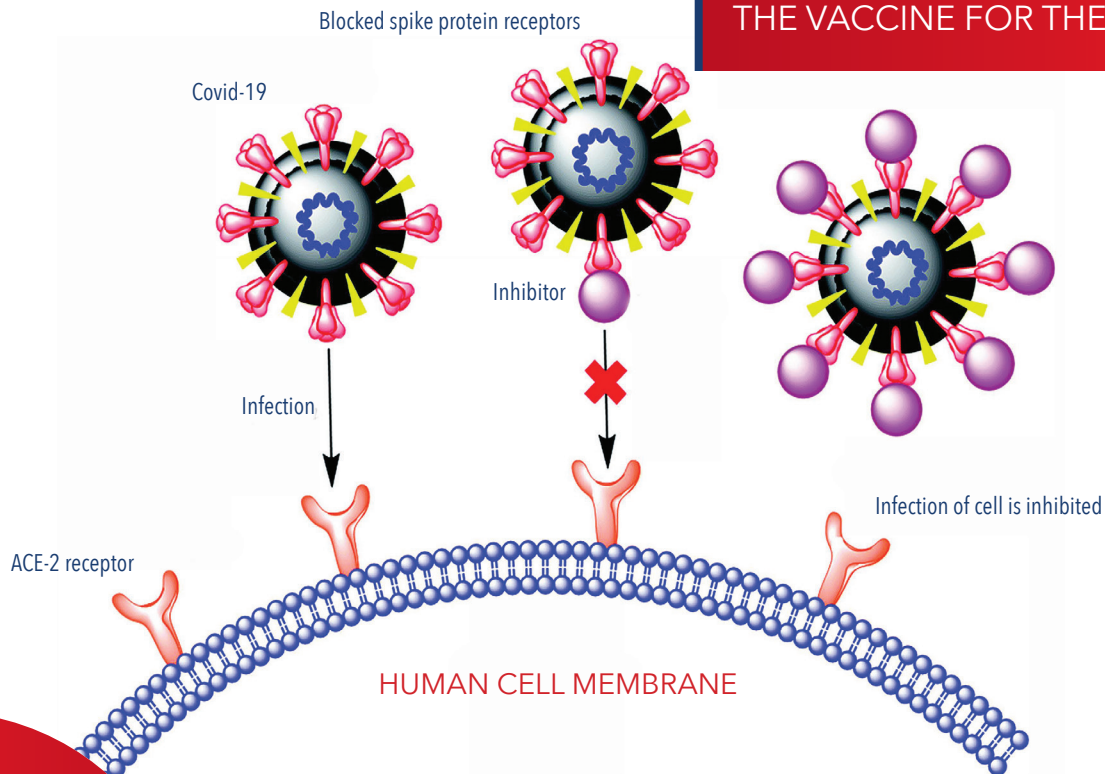

Most Covid antibody testing available only determines if a patient has the IgG, IgM and IgA antibodies - not if they have sufficient neutralizing antibodies that block the virus from binding with the ACE2 receptor, the critical step that leads to infection.

Having a semi-Quantitative test that provides a measurement of No, Low, Med and High can determine the the risk level for those that may be susceptible.

WHICH PERSON CONTINUES TO MAINTAIN THE PROTECTION FROM THE VACCINE FOR THE VIRUS?
